

## The history of the tortoise

If you go back far enough, everything lived in the sea. At various points in evolutionary history, enterprising individuals within many different animal groups moved out onto the land, sometimes even to the most parched deserts, taking their own private seawater with them in blood and cellular fluids. In addition to the reptiles, birds, mammals and insects which we see all around us, other groups that have succeeded out of water include scorpions, snails, crustaceans such as woodlice and land crabs, millipedes and centipedes, spiders and various worms. And we mustn't forget the plants, without whose prior invasion of the land none of the other migrations could have happened.

Moving from water to land involved a major redesign of every aspect of life, including breathing and reproduction. Nevertheless, a good number of thoroughgoing land animals later turned around, abandoned their hard-earned terrestrial re-tooling, and returned to the water again. Seals have only gone part way back. They show us what the intermediates might have been like, on the way to extreme cases such as whales and dugongs. Whales (including the small whales we call dolphins) and dugongs, with their close cousins the manatees, ceased to be land creatures altogether and reverted to the full marine habits of their remote ancestors. They don't even come ashore to breed. They do, however, still breathe air, having never developed anything equivalent to the gills of their earlier marine incarnation. Turtles went back to the sea a very long time ago and, like all vertebrate returnees to the water, they breathe air. However, they are, in one respect, less fully given back to the water than whales or dugongs, for turtles still lay their eggs on beaches.

There is evidence that all modern turtles are descended from a terrestrial ancestor which lived before most of the dinosaurs. There are two key fossils called *Proganochelys quenstedti* and *Palaeochersis talampayensis* dating from early dinosaur times, which appear to be close to the ancestry of all modern turtles and tortoises. You might wonder how we can tell whether fossil animals lived on land or in water, especially if only fragments are found. Sometimes it's obvious. Ichthyosaurs were reptilian contemporaries of the dinosaurs, with fins and streamlined bodies. The fossils look like dolphins and they surely lived like dolphins, in the water. With turtles it is a little less obvious. One way to tell is by measuring the bones of their forelimbs.

Walter Joyce and Jacques Gauthier, at Yale University, obtained three measurements in these particular bones

of 71 species of living turtles and tortoises. They used a kind of triangular graph paper to plot the three measurements against one another. All the land tortoise species formed a tight cluster of points in the upper part of the triangle; all the water turtles cluster in the lower part of the triangular graph. There was no overlap, except when they added some species that spend time both in water and on land. Sure enough, these amphibious species show up on the triangular graph approximately half way between the 'wet cluster' of sea turtles and the 'dry cluster' of land tortoises. The next step was to determine where the fossils fell. The bones of *P. quenstedti* and *JR. talampayensis* leave us in no doubt. Their points on the graph are right in the thick of the dry cluster. Both these fossils were dry-land tortoises. They come from the era before our turtles returned to the water.

You might think, therefore, that modern land tortoises have probably stayed on land ever since those early terrestrial times, as most mammals did after a few of them went back to

the sea. But apparently not. If you draw out the family tree of all modern turtles and tortoises, nearly all the branches are aquatic. Today's land tortoises constitute a single branch, deeply nested among branches consisting of aquatic turtles. This suggests that modern land tortoises have not stayed on land continuously since the time of *P. quenstedti* and *P. talampayensis*. Rather, their ancestors were among those who went back to the water, and they then re-emerged back onto the land in (relatively) more recent times.

Tortoises therefore represent a remarkable double return. In common with all mammals, reptiles and birds, their remote ancestors were marine fish and before that various more or less worm-like creatures stretching back, still in the sea, to the primeval bacteria. Later ancestors lived on land and stayed there for a very large number of generations. Later ancestors still evolved back into the water and became sea turtles. And finally they returned yet again to the land as tortoises, some of which now live in the driest of deserts.

## Questions 1-4

Answer the questions below.

Choose **NO MORE THAN THREE WORDS** from the passage for each answer.

Write your answers in boxes **1-4** on your answer sheet.

- 1 What had to transfer from sea to land before any animals could migrate? **1**.....
- 2 Which **TWO** processes are mentioned as those in which animals had to make big changes as they moved onto land? **2**.....
- 3 Which physical feature, possessed by their ancestors, do whales lack? **3**.....
- 4 Which animals might ichthyosaurs have resembled? **4**.....

## Questions 5-7

Do the following statements agree with the information given in Reading Passage?

In boxes **5-7** on your answer sheet, write

**TRUE** if the statement agrees with the information

**FALSE** if the statement contradicts the information

**NOT GIVEN** if there is no information on this

- 5..... Turtles were among the first group of animals to migrate back to the sea.
- 6..... It is always difficult to determine where an animal lived when its fossilised remains are incomplete.
- 7..... The habitat of ichthyosaurs can be determined by the appearance of their fossilised remains.

## Questions 8-13

Complete the flow-chart below.

Choose **NO MORE THAN TWO WORDS AND/OR A NUMBER** from the passage for each answer.

Write your answers in boxes **8-13** on your answer sheet.

## Method of determining where the ancestors of turtles and tortoises come from

### Step 1

71 species  
of living  
turtles and  
tortoises  
were  
examined  
and a total  
of

**8**.....

..... were  
taken from  
the bones  
of their  
forelimbs.

### **Step 2**

The data  
was  
recorded  
on a

**9**.....

.....  
(necessary  
for  
comparing  
the  
information  
).

Outcome:  
Land  
tortoises  
were  
represente  
d by a  
dense

**10**.....

..... of  
points  
towards  
the top.

Sea turtles  
were  
grouped  
together in  
the bottom

part.

### **Step 3**

The same  
data was  
collected  
from some  
living

**11**.....

.....  
species  
and added  
to the other  
results.

Outcome:  
The points  
for these  
species  
turned out  
to be  
positioned  
about

**12**.....

..... up the  
triangle  
between  
the land  
tortoises  
and the  
sea turtles.

### **Step 4**

Bones of P  
quenstedti  
and P.  
talampaye  
nsis were  
examined  
in a similar  
way and  
the results  
added.

Outcome:  
The  
position of  
the points  
indicated  
that both  
these  
ancient  
creatures  
were  
**13**.....  
.....

### Questions 14

*Choose the correct letter, **A, B, C or D**.*

*Write the correct letter in box **14** on your answer sheet.*

*According to the writer, the most significant thing about tortoises is that*

- A they are able to adapt to life in extremely dry environments.
- B their original life form was a kind of primeval bacteria.
- C they have so much in common with sea turtles.
- D they have made the transition from sea to land more than once.

**Solution:**

- |                               |                        |
|-------------------------------|------------------------|
| 1. plants                     | 8. 3 measurements      |
| 2. breathing and reproduction | 9. (triangular) graph  |
| 3. gills                      | 10. cluster            |
| 4. dolphins                   | 11. amphibious         |
| 5. NOT GIVEN                  | 12. half way           |
| 6. FALSE                      | 13. dry-land tortoises |
| 7. TRUE                       | 14. D                  |
